

DOCUMENT CHANGE REQUEST

DCR number 592

Changes required for: Qualification

Originator: J. Wong

Date: 2010/04/09

Date sent: 2010/04/09

Organisation: ESA/ESTEC

Status: IMPLEMENTED

Title: Coaxial Triaxial and Symmetric Cables Flexible -200 to +180 degreeC

Number: 3902/002

Issue: 2

Other documents affected:

Page:

Changes indicated in the copy marked up by W. L. Gore GmbH reference Issue 3, Draft 1 dated July 2009 and submitted to the ESCC Secretariat on 9 April 2010.

Paragraph:

Changes indicated in the copy marked up by W. L. Gore GmbH reference Issue 3, Draft 1 dated July 2009 and submitted to the ESCC Secretariat on 9 April 2010.

Original wording:

Proposed wording:

Refer to Box 7 above.

Justification:

Addition of new balanced shielded variants numbers 26 to 30 inclusive. Qualification data submitted by W.L. Gore GmbH on 26 March 2010 in support of adding the new variants.

---	---	--------------------------------

1. GENERAL

1.1 SCOPE

This specification details the ratings, physical and electrical characteristics, test and inspection data for flexible, coaxial, impedance controlled, radio frequency cables with 1 and 2 shields, and for symmetric impedance radio frequency wires with 1 shield, -200 to +180 °C. It shall be read in conjunction with ESCC Generic Specification No.3902, the requirements of which are supplemented herein.

1.2 COMPONENT TYPE VARIANTS

Variants of the basic types of datalines specified herein, which are also covered by this specification, are given in Table 1(a).

1.3 MAXIMUM RATINGS

The maximum ratings, which shall not be exceeded at any time during use or storage, applicable to the finished datalines specified herein, are as scheduled in Table 1(b).

1.4 PARAMETER DERATING INFORMATION

The derating information applicable to the finished wires and cables specified herein is as follows:

- The maximum current for each wire used in a bundle shall be:-

$$I_{Bmax} = I_{max} \times \frac{29 - n}{28} \quad (\text{for } 1 \leq n \leq 15)$$

$$I_{Bmax} = \frac{I_{max}}{2} \quad (\text{for } n > 15)$$

where n = number of wires in the bundle;

- The temperature derating information is shown in Figure 1 with maximum current I_{max} for a single wire.
- The derating factors contained herein indicate maximum stress values and do not preclude further derating.

1.5 PHYSICAL DIMENSIONS AND CHARACTERISTICS

The physical dimensions and characteristics of the datalines specified herein, are shown in Table 1(a) and Figure 2 respectively.

1.6 FUNCTIONAL DIAGRAM

Not applicable.

2. APPLICABLE DOCUMENTS

The following documents form part of this specification and shall be read in conjunction with it:-

- (a) ESCC Generic Specification No. 3902, Cables, Coaxial, Radio Frequency, Flexible.
- (b) ESA PSS-01-301, Derating Requirements Applicable to Electronic, Electrical and Electro-Mechanical Components.
- (c) MIL-C-17, Cables, Radio Frequency, Flexible and Semirigid, General Specification for.
- (d) IEC Publication No. 96-1, Radio Frequency Cables, Part 1: General Requirements and Measuring Methods.
- (e) GSC-05-2616-00, LAN Triaxcable, 75Ω.

3. TERMS, DEFINITIONS, ABBREVIATIONS, SYMBOLS AND UNITS

For the purpose of this specification, the terms, definitions, abbreviations, symbols and units specified in ESCC Basic Specification No. 21300 and ESCC Generic Specification No. 3902 shall apply. In addition, the following definitions shall be used:-

Cables	= Datalines (general term).
Cable with 1 shield	= Coaxial.
Cable with 2 shields	= Triaxial
Symmetrical Type	= Balanced Shielded Lines.
WFS	= Wrapped Foil Shield.
BS	= Braided Shield.

4. REQUIREMENTS

4.1 GENERAL

The complete requirements for procurement of the finished datalines specified herein shall be as stated in this specification and ESCC Generic Specification No. 3902. Deviations from the Generic Specification, applicable to this Detail Specification only, are listed in Para. 4.2.

Deviations from the applicable Generic Specifications and this Detail Specification, formally agreed with specific Manufacturers on the basis that the alternative requirements are equivalent to the ESCC requirements and do not affect the components' reliability, are listed in the appendices attached to this specification.

4.2 DEVIATIONS FROM GENERIC SPECIFICATION

4.2.1 Deviations from Special In-process Controls

- (a) Para. 5.3.1, "Insulation Flaws (Spark Test)": Shall be performed using the following test voltages.

	VARIANT													
	03	04	05	06	10	11	12	13	20	21	22	23	24	25
TEST VOLTAGE (kVAC)	0.9	1.0	1.95	1.75	1.0	1.95	3.15	3.15	2.5	1.0	0.8	1.0	1.0	1.4

VARIANT					
26	27	28	29	30	
Test Voltage (kVAC)	1.0	1.0	1.0	1.1	1.4

	ESCC Detail Specification No. 3902/002	PAGE 11 12 ISSUE 23 <i>Draft 1</i>
---	---	--

4.2.2 Deviations from Final Production Tests (Chart II)

- (a) Para. 9.7, "Voltage Test": To be performed in accordance with Para. 4.8.13 of this specification.
- (b) Para. 9.10, "Characteristic Impedance": To be performed in accordance with Para. 4.8.14 of this specification.
- (c) Para. 9.11, "Attenuation": To be performed in accordance with Para. 4.8.15 of this specification.
- (d) Para. 9.12, "Structural Return Loss": To be performed in accordance with Para. 4.8.16 of this specification.
- (e) "Time Delay": Shall be performed in accordance with Para. 4.8.18 of this specification immediately following the measurement of "Attenuation".
- (f) "Time Delay Conductor Difference": Shall be performed in accordance with Para. 4.8.19 of this specification immediately following the measurement of "Time Delay".

4.2.3 Deviations from Burn-in and Electrical Measurements (Chart III)

None.

4.2.4 Deviations from Qualification Tests (Chart IV)

- (a) Para. 9.7, "Voltage Test": To be performed in accordance with Para. 4.8.13 of this specification.
- (b) Para. 9.10, "Characteristic Impedance": To be performed in accordance with Para. 4.8.14 of this specification.
- (c) Para. 9.11, "Attenuation": To be performed in accordance with Para. 4.8.15 of this specification.
- (d) Para. 9.12, "Structural Return Loss": To be performed in accordance with Para. 4.8.16 of this specification.
- (e) "Shielding Effectiveness": Shall be performed in accordance with Para. 4.8.17 of this specification at any point in Chart IV.

4.2.5 Deviations from Lot Acceptance Tests (Chart V)

- (a) Para. 9.11, "Attenuation": To be performed in accordance with Para. 4.8.15 of this specification.
- (b) Para. 9.12, "Structural Return Loss": To be performed in accordance with Para. 4.8.16 of this specification.

4.3 MECHANICAL REQUIREMENTS

4.3.1 Dimension Check

The dimensions of the datalines specified herein shall be checked. They shall conform to those shown in Table 1(a), Figure 2 and Para. 4.4 of this specification (see the Table following for list of parameters to be checked).

---	---	---

4.3.2 Weight

The maximum weight of the datalines specified herein shall be measured in accordance with Para. 9.2 of ESCC Generic Specification No. 3902 and shall be as specified in Table 1(a) of this specification.

4.3.3 Adhesion of the Inner Conductor

Minimum stripping force: 1.0N.

4.4 MATERIALS AND FINISHES

The materials and finishes shall be as specified herein. Where a definite material is not specified, a material which will enable the components specified herein to meet the performance requirements of this specification shall be used. Acceptance or approval of any constituent material does not guarantee acceptance of the finished product.

4.4.1 Construction of Datalines

4.4.1.1 Coaxial Cables

The coaxial cables shall be constructed such that an inner conductor shall be centred evenly within its dielectric material. This construction shall be the core to be covered by a braided shield, i.e. outer conductor. This construction is then covered by an outermost jacket in accordance with Figure 2(a).

Inner Conductor	:	Para. 4.4.2.
Dielectric	:	Para. 4.4.3.
Shield	:	Para. 4.4.6.
Jacket	:	Para. 4.4.10.

4.4.1.2 Triaxial Cables

The triaxial cables shall be constructed analogue to the coaxial cables in accordance with Figure 2(b) such that an inner conductor shall be centred evenly within its dielectric material. This construction shall be the core to be covered by a braided shield or inner shield. The inner shield is also called the outer conductor.

This construction is then covered with an inner sheath, that shall provide enough insulating properties so that the inner shield can carry a different potential than the outer shield. For this reason, all electrical tests to be carried out on the outermost jackets are also applicable to this inner sheath.

Usually the outer shield of the triaxial cables shall have the same construction as the shields of the other datalines. For exceptions, see Para. 4.4.9.

Inner Conductor	:	Para. 4.4.2.
Dielectric	:	Para. 4.4.3.
Shield	:	Para. 4.4.6.
Inner Jacket	:	Para. 4.4.8.
Second Shield	:	Para. 4.4.9.
Jacket	:	Para. 4.4.10.

	ESCC Detail Specification No. 3902/002	PAGE 14 15 ISSUE 2 3 Draft 1
---	---	------------------------------------

4.4.1.3 Balanced Shielded Lines

The balanced shielded lines, sometimes also called twinax or symmetrical cables, shall also be impedance controlled datalines. They are constructed such that 2 conductors, each evenly centred within its dielectric, are twisted together with 2 fillers and then covered by a shield with drainwire, in accordance with Figure 2(c). This construction is then covered by an outer jacket.

Inner Conductor	:	Para. 4.4.2.
Dielectric	:	Para. 4.4.3.
Filler	:	Para. 4.4.4.
Binder	:	Para. 4.4.5.
Shield	:	Para. 4.4.6.
Drainwire	:	Para. 4.4.7.
Jacket	:	Para. 4.4.10.

NOTES

1. Variant 26 to 30 without Drainwire
2. Variant 26 without Fillers

4.4.1.4 Lay Length of Balanced Shielded Lines

The lay length of all balanced shielded lines shall not be less than 12 times and not more than 16 times the outside diameter of the unshielded andunjacketed cable. This requirement will lead to the following lay length and/or twist per metre respectively.

Variant	Lay Length (mm)		Twists/Metre		Variant	Lay Length (mm)		Twist / Metre	
	Min.	Max.	Min.	Max.		Min.	Max.	Min.	Max.
20	29	38	26	34	26	21	27	37	47
21	50	67	15	20	27	22	30	34	45
22	19	26	38	53	28	27	35	28	37
23	31	42	24	32	29	36	48	21	28
24	38	51	20	26	30	44	57	18	23
25	50	67	15	20					

4.4.2 Inner Conductor

Applicable to coaxial, triaxial cables and balanced shielded lines.

4.4.2.1 Material Characteristics

All strands used in the manufacture of the conductor shall be silver-coated high strength copper alloy for AWG 32 to AWG 24 and silver-coated, soft or annealed, oxygen free, high conductivity copper for AWG 22 and AWG 20.

On silver-coated strands, the thickness of silver shall be 2.0µm minimum.

On all copper conductors, any strand shall show a 10% minimum elongation.

For high strength copper alloy conductors, the tensile characteristics shall be not less than 6.0% in elongation and 35kg/mm² in tensile strength.

For determination of the conductor resistance at +20°C, as mentioned in Para. 9.5 of ESCC Generic Specification No. 3902, the α coefficient for copper alloy is 0.0035.

4.4.2.2 Stranding

The conductors shall be constructed of concentrically laid strands so as to produce a smooth and uniform conductor of circular cross-section and free from any high strands or other surface irregularities.

The length of lay of the external layer shall be not less than 8, nor more than 16 times the maximum conductor diameter specified in Table 1(a).

4.4.3 Dielectric

Applicable to coaxial, triaxial cables and balanced shielded lines.

4.4.3.1 Material

Any dielectric material shall be virgin material, i.e. expanded, microporous PTFE or wrapped PTFE with only those additives that are necessary for processing and pigmentation.

Variant	Material
All coaxes and triaxes 21 to 25 30	Expanded, microporous PTFE
20	Wrapped PTFE

4.4.3.2 Construction

The dielectric shall have a uniform cross-section throughout the length of the inner core or wire and the conductor shall be evenly centred in the dielectric.

The nominal diameter of the dielectric shall be in accordance with Table 1(a).

4.4.4 Filler

Fillers shall be used only with the balanced shielded lines so as to ensure a smooth and uniform diameter under the shielding in order to contribute to a uniform impedance over the length of the cable.

4.4.4.1 Material

The filler material as used for the balanced shielded lines shall be expanded, microporous PTFE with only those additives necessary for processing.

4.4.4.2 Construction

The filler material shall be extruded or wrapped from tapes to the diameters as given in Table 1(a).

4.4.5 Binder

Applicable to balanced shielded lines ~~only~~ for Variant 22. and Variant 26 to 30

Binders shall be used as appropriate over the 2 twisted insulated wires and fillers of the balanced shielded lines, if necessary.

	<p>ESCC Detail Specification No. 3902/002</p>	<p>PAGE 18 17 ISSUE 2 3 Draft 1</p>
---	---	---

4.4.5.1 Material

The material shall be virgin, wrapped, expanded, microporous PTFE with only those additives necessary for processing.

4.4.5.2 Construction

The material shall be wrapped with an overlap of 20% maximum.

4.4.6 Shield

The term "first shield" and "second shield" shall be used only for triaxial cables. All other datalines, i.e. the balanced shielded lines and the coaxial cables, have only 1 shield, which is described below.

2 types of shield shall be used:-

- (a) Wrapped Foil Shield as part of a second shield for Variant 13.
- (b) Braided Shield for all other Variants.

4.4.6.1 Material Characteristics

All strands shall meet the requirements for silver-coated annealed copper as outlined in Para. 4.4.2.1 of this specification, but the thickness of silver shall be 2.5µm minimum.

Any strand shall show a 10% minimum elongation.

4.4.6.2 Construction

The strand size shall be as specified in Table 1(a) of this specification.

(a) Braided Shield

The braided shield type shall be of push-back type and provide not less than 90% coverage. The coverage factor K is calculated as follows:-

$$K = (2F - F^2)$$

$$F = \frac{N \times P \times d}{\sin \alpha}$$

$$\tan \alpha = 2\pi \frac{(D \times 2d) \times P}{C}$$

- K = coverage (%).
- N = number of strands.
- d = shield strand diameter (mm).
- α = angle of shield with cable axis in degrees.
- D = effective diameter of core under shield (mm).
- C = number of carriers.
- P = serving pitch/mm.

	ESCC Detail Specification No. 3902/002	PAGE 17 18 ISSUE 2 3 <i>Draft 1</i>
---	---	---

(b) **Wrapped Foil Shield**

The second shield of Variant 13 is superscreened so as to provide extra shielding effectiveness. For this reason, the second shield is constructed with a braided shield over a wrapped foil shield. Between these 2 shields, a graphited PTFE to inhibit abrasion between the two shield layers and increase flexibility of the overall cable is included.

The wrapped foil shield shall be silver plated copper of overall thickness 0.025mm and silver plating of 0.37µm minimum. It shall be wrapped with a 20% overlap.

4.4.7 **Drainwire**

Applicable to balanced shielded lines.

4.4.7.1 **Material Characteristics**

Identical with the inner conductor as specified in Para. 4.4.2.1.

4.4.7.2 **Stranding**

Identical with the inner conductor as specified in Para. 4.4.2.2.

4.4.7.3 **Construction**

All balanced shielded lines shall have a drain wire placed *helically* ~~longitudinally~~ along the cable core, directly under the shield, electrically in contact with the braided shield, as specified in Figure 2(c).

4.4.8 **Inner Sheath**

All triaxial cables shall have 2 jackets, the outermost jacket of which shall be as described in Para. 4.4.10 and the inner sheath, dividing the 2 shields from each other, shall be as described in the following. The thickness of the inner sheath shall be 0.13mm minimum.

4.4.8.1 **Material**

The material shall be virgin extruded PTFE copolymer PFA with only those additives which are necessary for processing, with or without binder, in accordance with Para. 4.4.5.

4.4.8.2 **Construction**

The material shall be extruded such that the shielded construction underneath is centred evenly within the jacket.

4.4.9 **Second Shield**

The second shield is applicable only to the triaxial cable and is constructed in the same way as the braided shield of the coaxial cables and the balanced shielded lines. Exceptionally, for Variant 13, the second shield consists of not only the braided shield but additionally a wrapped foil shield underneath (see Para. 4.4.6).

4.4.9.1 **Material**

The material of the braided second shield of the triaxial cables is exactly the same one as the shield described in Para. 4.4.6.1. The exception is Variant 13 (see Para. 4.4.6.2).

4.4.9.2 Construction

The construction of the braided second shield of the triaxial cables is exactly the same as the one described in Para. 4.4.6.2(a).

The wrapped foil shield of the second shield of Variant 13 is placed underneath the braided shield, between inner jacket and outer jacket. Its construction is in accordance with Para. 4.4.6.2(c).

4.4.10 Jacket

All triaxial cables shall have 2 jackets, the outermost jacket of which shall be as described in the following with the jacket of the coaxial cables and the balanced shielded lines. For the description of the inner sheath of the triaxial cables, see Para. 4.4.8. The thickness of the jacket shall be 0.13mm minimum

4.4.10.1 Material

The material shall be virgin material, i.e. extruded PTFE copolymer PFA as standard jacket material or expanded, microporous PTFE underneath for Variant 13, each with only those additives that are necessary for processing and pigmentation.

4.4.10.2 Construction

For Variant 13 where, for flexibility reasons, expanded PTFE is used under the extruded PFA, the material shall be wrapped in 2 wraps, each with a minimum overlap of 52%.

The extruded PTFE/PFA shall be extruded such that the construction underneath is centred evenly within the jacket.

4.4.11 Colour Coding

The dielectric material of all coaxial and triaxial cables and the fillers of the balanced shielded lines shall have the natural colour of its material.

4.4.11.1 Coaxial Cable Colour Coding

The colour of the jackets of the coaxial cables shall be as follows.

COAXIAL CABLE COLOUR CODING

Variant	AWG Size	Impedance (Ω)	Colour of Jacket
03	28	50	White
04	26	50	Orange
05	20	50	Green
06	26	75	Black

4.4.11.2 Triaxial Cable Colour Coding

The colour of the jackets of the triaxial cables shall be as follows.

TRIAxIAL CABLE COLOUR CODING

Variant	AWG Size	Impedance (Ω)	Colour of Jacket
10	26	50	Orange
11	20	50	Green
12	20	75	White/Natural
13	20	75	White

4.4.11.3 Balanced Shielded Line Colour Coding

The colour of the jackets of the balanced shielded lines shall be as follows.

COLOUR CODING OF BALANCED SHIELDED LINES

	Variant	AWG Size	Impedance (Ω)	Colour of Single Wires	Colour of Jacket
	20	24	75	Black/White	Black
	21	22	100	Red/Blue	Red
	22	30	120	White	Blue
	23	28	120	White	Green
	24	26	120	Red/Blue	Blue
	25	24	120	Red/Blue	Grey
	26	30	100	White	Blue
	27	28	100	White	Green
4.5	MARKING	28	100	White	Blue
		29	100	White	Grey
4.5.1	General	30	100	White	Red

The marking of all spools of finished datalines delivered to this specification shall be in accordance with the requirements of ESCC Basic Specification No. 21700. Each spool shall be marked in respect of:-

- The ESCC Component Number.
- Characteristics.
- Traceability Information.
- Additional Marking.

4.5.2 The ESCC Component Number

Each component shall bear the ESCC Component Number which shall be constituted and marked as follows:

390200203B

Detail Specification Number _____

Type Variant (see Table 1(a)) _____

Testing Level _____

4.5.3 Characteristics

The characteristics shall show the length(s) of the finished dataline wound on each spool and shall be marked as follows:-

100m

Length in Metres (see Note) _____

Symbol for Metres _____

N.B.

Whenever the length is less than 100 metres, insert a zero in the first block (example: 075m). If more than 1 length of finished dataline is wound on a spool, the characteristics of each length shall be marked as above.

	ESCC Detail Specification No. 3902/002	PAGE 20 21 ISSUE 2 3 <i>Draft 1</i>
---	---	---

4.5.4 Traceability Information

Each spool shall be marked in respect of traceability information in accordance with the requirements of ESCC Basic Specification No. 21700.

4.5.5 Additional Marking

Each spool shall bear the Manufacturer's Quality Control Inspector's stamp.

4.6 ELECTRICAL MEASUREMENTS

4.6.1 Electrical Measurements at Room Temperature

The parameters to be measured at room temperature are scheduled in Table 2. Unless otherwise specified, the measurements shall be performed at $T_{amb} = +22 \pm 3 \text{ }^{\circ}\text{C}$.

4.6.2 Electrical Measurements at High and Low Temperatures

Not applicable.

4.6.3 Circuits for Electrical Measurements

Not applicable.

4.7 BURN-IN TESTS

Not applicable.

4.8 ENVIRONMENTAL AND ENDURANCE TESTS (CHARTS IV AND V OF ESCC GENERIC SPECIFICATION NO. 3902)

4.8.1 Mechanical Properties of Conductor

As detailed in Paras. 4.4.2.1, 4.4.6.1, 4.4.7.1 and 4.4.9.1 of this specification.

4.8.2 Alternate Bending Resistance

The applied weights and bending diameter for alternate bending resistance are given in Table A.

Number of cycles : 500 minimum.

TABLE A - ALTERNATE BENDING RESISTANCE, LOAD AND DIAMETER

Variant	Z ₀ (Ω)	Weight (kg)	Bending Diameter (mm)
03	50	0.25	15
04	50	0.25	20
05	50	0.50	40
06	75	0.25	30
10	50	0.25	25
11	50	0.50	50
12	75	0.50	70
13	75	0.50	80
20	75	0.50	40
21	100	1.00	50
22	120	0.50	25
23	120	0.50	35
24	120	0.50	40
25	120	0.80	55

4.8.3 Accelerated Ageing Stability

Ageing temperature : +200 ± 5 °C.

Shrinkage/Protrusion : See Table B.

Wrap Test : Mandrel diameters as per Table C.

TABLE B - SHRINKAGE/PROTRUSION

Variant	Z ₀ (Ω)	Max. Shrinkage or Protrusion (mm)
12	75	3.0
13	75	3.0
All others		2.0

Maximum Capacitance Change : +7.0%.

Maximum Attenuation Change : +7.0%.

Maximum Structural Return Loss Change : -10%.

Variant	Z ₀ (Ω)	Weight (kg)	Bending Diameter (mm)
26	100	0.40	20
27	100	0.50	25
28	100	0.50	30
29	100	0.75	45
30	100	1.00	50

4.8.4 Cold Bend Test

Chamber temperature : -80 ± 5 °C.
Mandrel diameter and load : See Table C.

TABLE C - COLD BEND TEST, MANDREL DIAMETERS AND LOADS

Variant	Z ₀ (Ω)	Weight (kg)	Mandrel Diameter (mm)
03	50	0.25	15
04	50	0.25	20
05	50	0.50	40
06	75	0.25	30
10	50	0.25	25
11	50	0.50	50
12	75	1.3	70
13	75	0.50	80
20	75	0.50	40
21	100	1.00	50
22	120	0.30	25
23	120	0.50	35
24	120	0.50	40
25	120	0.90	55

4.8.5 Solderability

No particular conditions are applicable.

4.8.6 Corona Extinction Voltage

As per Table 2.

4.8.7 Resistance to Fluids

No particular conditions are applicable.

4.8.8 Flammability Resistance

No particular conditions are applicable.

4.8.9 Radiation Resistance

- (a) Insulation Resistance : Shall stay within specified limits, see Table 2.
- (b) Voltage Test : Shall stay within specified limits, see Table 2.
- (c) Maximum Capacitance Change : +7.0%.
- (d) Maximum Impedance Change : +7.0%.
- (e) Corona extinction voltage : Shall stay within specified limits, see Table 2.

Variant	Z ₀ (Ω)	Weight (kg)	Mandrel Diameter (mm)
26	100	0,25 0,25	25
27	100	0,30	25
28	100	0,40	30
29	100	0,70	50
30	100	0,90	55

4.8.10 Outgassing

No particular conditions are applicable.

4.8.11 Long-term Ageing Test

Ageing temperature : + 180 ± 5 °C.

(a) Insulation Resistance : Shall stay within specified limits, see Table 2.

(b) Voltage Test : Shall stay within specified limits, see Table 2.

(c) Maximum Capacitance Change : + 7.0%.

(d) Maximum Impedance Change : + 7.0%.

(e) Corona extinction voltage : Shall stay within specified limits, see Table 2.

4.8.12 Atomic Oxygen Resistance

The outer surface of the datalines is resistant against atomic oxygen and shall be verified in accordance with the requirements of the Qualifying Space Agency (Q.S.A.).

4.8.13 Voltage Test

The voltage test shall be performed in accordance with ESCC Generic Specification No. 3902, Para. 9.7.

4.8.14 Characteristic Impedance

The characteristic impedance of all coaxes and triaxes shall be measured according to MIL-DTL-17, Para. 4.8.7 using a time domain reflectometer (T.D.R.). All balanced shielded lines shall be measured according to MIL-G-17, Para. 4.8.7 using a T.D.R. with a symmetrical input/output. All measurements shall be performed on cables with a minimum length of 3.0 metres.

MIL-DTL-17

Impedance reference shall be defined before test.

4.8.15 Attenuation

Minimum measurement length ≥ 15 metres.

Connectors, precision adaptors and symmetrical transformers shall be defined before the test.

TABLE D1 - MAXIMUM ATTENUATION OF COAXIAL AND TRIAXIAL CABLES

Variant	Attenuation in dB/100m				
	10MHz	50MHz	100MHz	500MHz	1.0GHz
03	15	34	48	108	154
04, 10	12	26	37	84	119
05, 11	5.5	12	17	38	55
06	6.8	14	20	45	64
12, 13	2.9	6.6	9.3	22	32

TABLE D2 - MAXIMUM ATTENUATION OF BALANCED SHIELDED LINES

Variant	Attenuation in dB/100m		
	10MHz	50MHz	100MHz
20	12	28	40
21	7.0	17	24
22	15	35	48
23	12	26	38
24	9.0	20	29
25	7.0	16	22

All other attenuation values for frequencies other than those specified above may be calculated according to the following (rounded) formula:

$$\alpha_{\text{new}} = \alpha_{\text{old}} \times \sqrt{\frac{f_{\text{new}}}{f_{\text{old}}}}$$

4.8.16 Structural Return Loss

To be performed on coaxes and triaxes only with a minimum measurement length of 15 metres.

Connectors and precision adaptors shall be defined before the test.

Frequency : Up to 1.0GHz.

Minimum Structural Return Loss : See Table 2.

4.8.17 Shielding Effectiveness

The shielding effectiveness of the cables shall be determined. Since the shielding effectiveness or transfer impedance respectively is a characteristic which is dependent only on constructional parameters, its performance shall be measured only once during qualification in accordance with IEC 96-1, 46 A 142 and Figure 1(b) of this specification.

4.8.18 Time Delay

The time delay of the balanced shielded lines shall be measured in accordance with Table 2 using a network analyser on a minimum length of 3.0 metres.

1(a) and 2(a) : Symmetrical Transformers (1×50Ω to 2×50Ω)

1(b) and 2(b) : Impedance Matching (50Ω to 75/100/120Ω)

A and B : Clamp connection

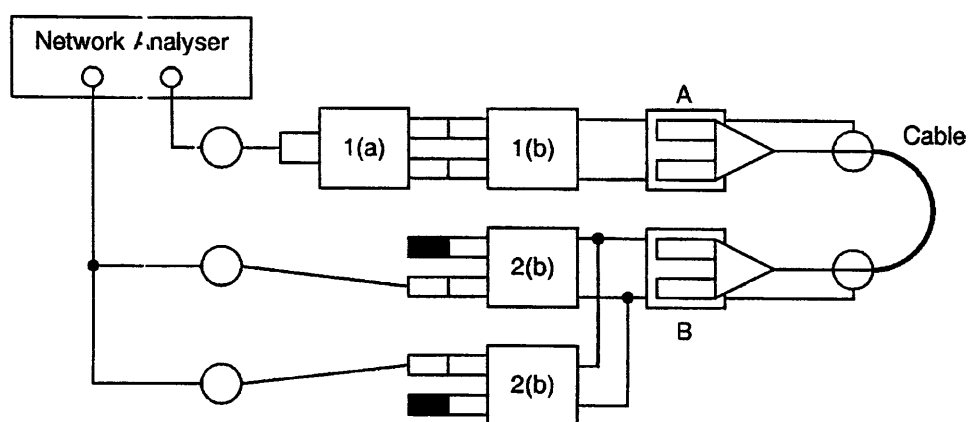

Variant	20 MHz	Attenuation 35 MHz	in dB/100m 80 MHz	100 MHz
26	25	33	50	54
27	20	26	38	43
28	17	22	32	36
29	11	15	22	25
30	9	12	17	20

A symmetrical 50Ω signal will be produced by the network analyser (0.3 - 3000 MHz), split into 2 symmetrical signals 1(a) and transformed to the desired impedance of the balanced shielded line under test 1(b). After the signal has passed the cable under measurement, the signal will be impedance matched to 50Ω 2(b) and retransformed to a single signal 2(a).

The specimen cable is connected to input and output A and B, and the time delay between input and output is measured and displayed by the network analyser.

4.8.19 Time Delay Conductor Difference

The time delay conductor difference of the balanced shielded lines shall be measured in accordance with Table 2 using a network analyser on a minimum length of 3.0 metres.

- 1(a) : Symmetrical Transformers ($1 \times 50\Omega$ to $2 \times 50\Omega$)
- 1(b) and 2(b) : Impedance Matching (50Ω to $75/100/120\Omega$)
- A and B : Clamp connection

A symmetrical 50Ω signal will be produced by the network analyser (0.3 - 3000 MHz), split into 2 symmetrical signals 1(a) and transformed to the desired impedance of the balanced shielded line under test 1(b). After the signal has passed 1 line of the symmetrical cable, connected to input A and output B, the signal will be impedance matched to 50Ω 2(b). The 1 open port of the impedance matching pad will be terminated by 50Ω . The 1 open port of the impedance matching pad will be terminated by 50Ω .

This procedure shall be repeated for the second single line of the symmetrical cable, and both values shall be compared, with the conductor difference displayed by the network analyser.
