#### 1. GENERAL

#### 1.1 <u>SCOPE</u>

This specification details the ratings, physical and electrical characteristics and test and inspection data for the component type variants and/or the range of components specified below. It supplements the requirements of, and shall be read in conjunction with, the ESCC Generic Specification listed under Applicable Documents.

#### 1.2 APPLICABLE DOCUMENTS

The following documents form part of this specification and shall be read in conjunction with it:

- (a) ESCC Generic Specification No. 9000.
- (b) MIL-STD-883, Test Methods and Procedures for Microelectronics.

#### 1.3 TERMS, DEFINITIONS, ABBREVIATIONS, SYMBOLS AND UNITS

For the purpose of this specification, the terms, definitions, abbreviations, symbols and units specified in ESCC Basic Specification No. 21300 shall apply.

#### 1.4 THE ESCC COMPONENT NUMBER AND COMPONENT TYPE VARIANTS

#### 1.4.1 <u>The ESCC Component Number</u>

The ESCC Component Number shall be constituted as follows:

Example: 920207701R

Detail Specification Reference: 9202077Component Type Variant Number: 01

• Total Dose Radiation Level Letter: R (as required)

## 1.4.2 <u>Component Type Variants</u>

The component type variants applicable to this specification are as follows:

| Variant<br>Number | Based on Type | Case     | Lead/Terminal Material and<br>Finish | Weight<br>max g | Total Dose<br>Radiation Level<br>Letter |
|-------------------|---------------|----------|--------------------------------------|-----------------|---|
| 01                | PE33632       | CQFPJ-68 | G2                                   | 10              | R [100kRAD(Si)]                         |

The lead/terminal material and finish shall be in accordance with the requirements of ESCC Basic Specification No. 23500.

Total dose radiation level letters are defined in ESCC Basic Specification No. 22900. If an alternative radiation test level is specified in the Purchase Order the letter shall be changed accordingly.

#### 1.5 MAXIMUM RATINGS

The maximum ratings shall not be exceeded at any time during use or storage. Prolonged use of the

device at the maximum ratings may reduce the device's overall reliability.

Maximum ratings shall only be exceeded during testing to the extent specified in this specification and when stipulated in Test Methods and Procedures of the ESCC Generic Specification.

| Characteristics                       | Symbols              | Maximum Ratings              | Units | Remarks          |
|---------------------------------------|----------------------|------------------------------|-------|------------------|
| Supply Voltage Range                  | $V_{DD}$             | -0.3 to 4                    | V     | Note 1           |
| Input Voltage Range                   | V <sub>IN</sub>      | -0.3 to V <sub>DD</sub> +0.3 | V     | Note 2           |
| DC Input Current Range                | I <sub>IN</sub>      | -10 to +10                   | mA    |                  |
| DC Output Current Range               | l <sub>out</sub>     | -90 to +110                  | mA    | Note 3           |
| Device Power Dissipation (Continuous) | P <sub>D</sub>       | 500                          | mW    |                  |
| Operating Temperature Range           | T <sub>op</sub>      | -40 to +85                   | °C    | T <sub>amb</sub> |
| Storage Temperature Range             | T <sub>stg</sub>     | -65 to +150                  | °C    |                  |
| Junction Temperature                  | Tj                   | +150                         | °C    |                  |
| Thermal Resistance, Junction to Case  | R <sub>th(j-c)</sub> | 15                           | °C/W  |                  |
| Soldering Temperature                 | T <sub>sol</sub>     | +260                         | °C    | Note 4           |

#### **NOTES:**

- All voltages are with respect to  $V_{SS}$ . Device is functional for  $2.85 \le V_{DD} \le 3.45 V$ .
- V<sub>DD</sub> + 0.3V shall not exceed 4V.
- The maximum output current of any single output for a maximum duration of 1 second.
- Duration 10 seconds maximum at a distance of not less than 1.6mm from the device body and the same terminal shall not be re-soldered until 3 minutes have elapsed.

#### 1.6 HANDLING PRECAUTIONS

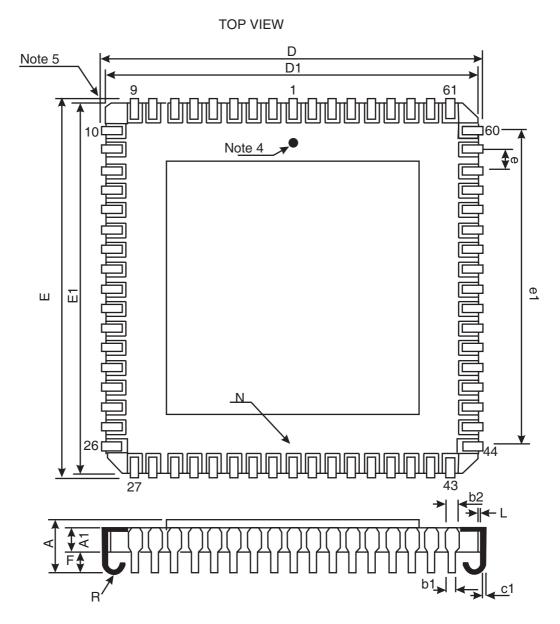

These devices are susceptible to damage by electrostatic discharge. Therefore, suitable precautions shall be employed for protection during all phases of manufacture, testing, packaging, shipment and any handling.

These components are categorised as Class 1 per ESCC Basic Specification No. 23800 with a minimum Critical Path Failure Voltage of 1000 Volts for all pins except DOUT, which has a minimum Critical Path Failure Voltage of 300 Volts. DOUT is a test pin only and does not affect functionality, operation or performance.

## 1.7 PHYSICAL DIMENSIONS AND TERMINAL IDENTIFICATION

## 1.7.1 Ceramic Quad Flat Package J-BEND (CQFPJ-68) - 68 Terminals

## **NOTES:**

- 1. Applies to all 68 terminals (17 per side).
- 2. 64 places. The true position pin spacing is 1.27mm between centrelines. Each pin centreline shall be located within ±0.13mm of its true longitudinal position relative to the package centrelines.
- 3. 4 places.
- 4. A terminal identification mark shall be located in the region of Pin 1 as shown. Terminal numbers shall increase counter clockwise when viewed as shown starting from the centre terminal (Pin 1).
- 5. Index corner: Terminal identification is specified by reference to the index corner as shown.
- 6. Radius.

#### 1.8 FUNCTIONAL DIAGRAM

## 1.9 PIN ASSIGNMENT AND DESCRIPTION

The table below describes each pin's assignment, type and standard, plus a brief description of its functionality.

| Pin<br>No. | Pin Name        | Pin Type | Pin<br>Standard | Valid Mode | Description                            |
|------------|-----------------|----------|-----------------|------------|--|
| Top sid    | e<br>e          |          |                 |            |  |
| 1          | R <sub>0</sub>  | Input    | CMOS            | Direct     | R Counter, bit 0 (LSB).                |

| 29         | M <sub>0</sub>  | Input    | CMOS            | Direct     | M Counter, bit 0 (LSB).                |

| Pin<br>No. | Pin Name        | Pin Type | Pin<br>Standard | Valid Mode | Description  |
|------------|-----------------|----------|-----------------|------------|--|
| 30         | M <sub>1</sub>  | Input    | CMOS            | Direct     | M Counter, bit 1.  |
| 31         | M <sub>2</sub>  | Input    | CMOS            | Direct     | M Counter, bit 2.  |
| 32         | M <sub>3</sub>  | Input    | CMOS            | Direct     | M Counter, bit 3.  |
| 33         | M <sub>4</sub>  | Input    | CMOS            | Direct     | M Counter, bit 4.  |
|            | S_WR            |          |                 | Serial     | Serial load enable input. While S_WR is "low", Sdata can be serially clocked. Primary register data are transferred to the secondary register on S_WR or HOP_WR rising edge. |
| 34         | M <sub>5</sub>  | Input    | CMOS            | Direct     | M Counter, bit 5.  |
|            | SDATA           |          |                 | Serial     | Binary serial data input. Input data entered MSB first.  |
| 35         | M <sub>6</sub>  | Input    | CMOS            | Direct     | M Counter, bit 6.  |
|            | SCLK            |          |                 | Serial     | Serial clock input. Sdata is clocked serially into the 20-bit primary register (E_WR "low") or the 8-bit enhancement register (E_WR "high") on the rising edge of SCLK.      |
| 36         | M <sub>7</sub>  | Input    | CMOS            | Direct     | M Counter, bit 7.  |
| 37         | M <sub>8</sub>  | Input    | CMOS            | Direct     | M Counter, bit 8 (MSB).  |
| 38         | A <sub>0</sub>  | Input    | CMOS            | Direct     | A Counter, bit 0 (LSB).  |

| 62         | FR              | Input    | CMOS                         | Both       | Reference frequency input.   |
| 63         | $V_{DD}$        | Power    | -                            | -          | Reference V <sub>DD</sub> (Note 1).  |
| 64         | $V_{DD}$        | Power    | -                            | -          | Digital core V <sub>DD</sub> (Note 1).   |
| 65         | ENH             | Input    | CMOS                         | Both       | Enhancement mode. When asserted "low" ("0"), enhancement register bit s are functional.  |
| 66         | NC              | -        | -                            | -          | Not Connected.   |
| 67         | MS2_SEL         | Input    | CMOS                         | Both       | MASH 1-1 select. "high" selects MASH 1-1 mode, "low" selects the MASH 1-1-1 mode.  |

| Pin<br>No. | Pin Name | Pin Type | Pin<br>Standard | Valid Mode | Description  |
|------------|----------|----------|-----------------|------------|--|
| 68         | RAND_EN  | Input    | CMOS            | Both       | K register LSB toggle enable. "high" enables the toggling of LSB. This is equivalent to having an additional bit for the LSB of K register. The frequency offset as a result of enabling this bit is the Phase Detector comparison frequency / 2 <sup>19</sup> . |

#### **NOTES:**

- 1. All  $V_{DD}$  pins are connected by diodes and must be supplied with the same positive voltage level.
- 2. All digital input pins (i.e. CMOS inputs of Group 1 below) have a  $70k\Omega$  pull-down resistor to ground.

The table below describes the pin groups to be tested.

| Group No. | Туре                        | Total No.<br>of Pins | Pin Numbers                               |
|-----------|-----------------------------|----------------------|---|
| 1         | CMOS Input with Pull-down   | 42                   | 1 to 8, 11 to 26, 29 to 43, 65, 67 and 68 |
| 2         | CMOS Input                  | 1                    | 62 (FR)                                   |
| 3         | RF Input                    | 2                    | 47 (FIN) and 48 (FIN)                     |
| 4         | High Current CMOS Output    | 2                    | 55 (PD_D) and 57 (PD_U)                   |
| 5         | Low Current CMOS Output     | 1                    | 52 (DOUT)                                 |
| 6         | High Resistance CMOS Output | 1                    | 50 (Cext)                                 |
| 7         | Open Drain Output           | 1                    | 51 (LD)                                   |
| 8         | Power                       | 9                    | 10, 27, 44, 46, 53, 59, 60, 63 and 64     |
| 9         | Ground                      | 7                    | 9, 28, 45, 49, 54, 58 and 61              |

## 1.10 FUNCTIONAL DESCRIPTION

## 1.10.1 <u>Overview</u>

The PE33632 consists of a prescaler, several counters, an 18-bit delta-sigma modulator (DSM) and a phase detector. The dual modulus prescaler divides the VCO frequency by either 10 or 11, depending on the value of the modulus select. Counters "R" and "M" divide the reference and prescaler outputs, respectively, by the integer values stored in a 20-bit register. An additional counter ("A") is used in the modulus select logic. The DSM modulates the A Counter outputs in order to achieve the desired fractional step.

The phase-frequency detector generates up and down frequency control signals. Data is written into the internal registers via a three-wire serial bus. There are also various operational and test modes and a lock detect output.

#### 1.10.2 Main Counter Chain

#### 1.10.2.1 Normal Operating Mode

Setting the  $\overline{PRE\_EN}$  control bit "low" enables the  $\div 10/11$  prescaler. The main counter chain then divides the RF input frequency (f<sub>in</sub>) by an integer or fractional number derived from the values in the "M", "A" Counters and the DSM input word K. The accumulator size is 18-bit, so the fractional value is fixed from the ratio K/2<sup>18</sup>. There is an additional bit in the DSM that acts like an extra bit (19th bit). This bit is enabled by asserting the pin RAND\_EN to "high". Enabling this bit has the benefit of reducing the spurious levels. However, a small frequency offset will occur. This positive frequency offset is calculated with the following equation:

$$f_{\text{offset}} = (f_r/(R+1))/2^{19}$$
 (1)

All of the following equations do not take into account this frequency offset. If this offset is important to a specific frequency plan, appropriate account needs to be taken.

In the normal mode, the output from the main counter chain  $(f_p)$  is related to the VCO frequency  $(f_{in})$  by the following equation:

$$f_p = f_{in}/[10 \times (M + 1) + A + K/2^{18}]$$
 (2)

Where  $A \le M + 1$ ,  $1 \le M \le 511$ 

When the loop is locked,  $f_{in}$  is related to the reference frequency  $(f_r)$  by the following equation:

$$f_{in} = [10 \times (M+1) + A + K/2^{18}] \times (f_r/(R+1))$$
 (3)

Where 
$$A \le M + 1$$
,  $1 \le M \le 511$ 

A consequence of the upper limit on A is that  $f_{in}$  must be greater than or equal to 90 x ( $f_r$  / (R + 1)) to obtain contiguous channels. The A Counter can accept values as high as 15, but in typical operation it will cycle from 0 to 9 between increments in M.

Programming the M Counter with the minimum allowed value of "1" will result in a minimum M Counter divide ratio of "2".

#### 1.10.2.2 Prescaler Bypass Mode

Setting the frequency control register bit  $\overline{PRE\_EN}$  "high" allows  $f_{in}$  to bypass the  $\div 10/11$  prescaler. In this mode, the prescaler and A Counter are powered down, and the input VCO frequency is divided by the M Counter directly. The following equation relates  $f_{in}$  to the reference frequency ( $f_r$ ):

$$f_{in} = (M + 1) \times (f_r/(R + 1))$$
 (4)

Where  $1 \le M \le 511$ 

In this mode, neither the A Counter nor the K Counter is used and therefore only integer-N operation is possible.

#### 1.10.3 Reference Counter Chain

The reference counter chain divides the reference frequency ( $f_r$ ) down to the phase detector comparison frequency ( $f_c$ ).

The output frequency of the 6-bit R Counter is related to the reference frequency by the following equation:

$$f_{c} = f_{r}/(R+1) \tag{5}$$

Where  $0 \le R \le 63$ 

Note that programming R with "0" will pass the reference frequency (f<sub>r</sub>) directly to the phase detector.

## 1.10.4 Register Programming

#### 1.10.4.1 Serial Interface Mode

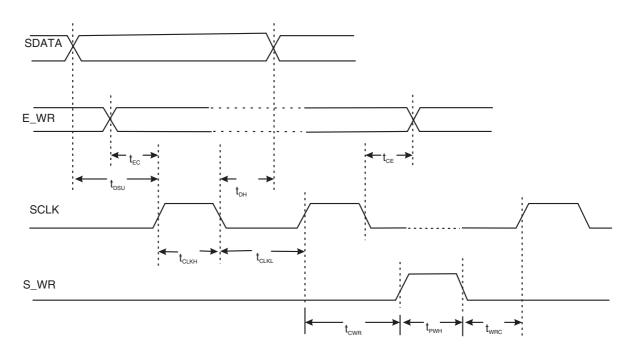

While the E\_WR input is "low" and the S\_WR input is "low", serial input data (SDATA input),  $B_0$  to  $B_{20}$ , are clocked serially into the primary register on the rising edge of SCLK, MSB ( $B_0$ ) first. The LSB is used as the address bit. When "0", the contents from the primary register are transferred to the secondary register on the rising edge of S\_WR according to the timing chart shown below. When "1", data are transferred to the auxiliary register according to the same timing chart. The secondary register is used to program the various counters, while the auxiliary register is used to program the DSM.

Data are transferred to the counters as shown in the tables below.

While the E\_WR input is "high" and the S\_WR input is "low", serial input data (SDATA input),  $B_0$  to  $B_7$ , are clocked serially to the enhancement register on the rising edge of SCLK, MSB ( $B_0$ ) first. The enhancement register is double buffered to prevent inadvertent control changes during serial loading, with buffer capture of the serially entered data performed on the falling edge of E\_WR according to the timing chart shown below. After the falling edge of E\_WR, the data provide control bits as shown in the tables below will have their bit functionality enabled by asserting the  $\overline{ENH}$  input "low".

## Serial Interface Timing Chart

## 1.10.4.2 Direct Interface Mode

Direct Interface Mode is selected by setting the DIRECT Input "high". Counter control bits are set directly at the pins as shown in the tables below.

#### NOTES:

- Serial data clocked serially on SCLK rising edge while E\_WR "low" and captured in secondary register on S\_WR rising edge.
- Serial data clocked serially on SCLK rising edge while E\_WR "high" and captured in double buffer on E\_WR falling edge.

#### 1.10.4.3 Enhancement Register

The functions of the enhancement register bits are shown below with all bits active "high".

| Bit Number | Bit Function | Description   |
|------------|--------------|---|
| 0          | Reserved     | Reserve bit - program to 0.   |
| 1          | Reserved     | Reserve bit - program to 0.   |
| 2          | FP Output    | Drives the M Counter output onto the DOUT output.   |
| 3          | Power Down   | Power down of all functions except programming interface.                                     |
| 4          | Counter Load | Immediate and continuous load of counter programming.   |
| 5          | MSEL Output  | Drives the internal dual modulus prescaler modulus select (MSEL) output onto the DOUT output. |
| 6          | FC Output    | Drives the reference counter output onto the DOUT output.                                     |
| 7          | LD Disable   | Disables the LD pin for quieter operation.  |

## 1.10.5 Phase Detector

The phase detector is triggered by rising edges from the main Counter ( $f_p$ ) and the reference Counter ( $f_c$ ). It has two outputs, namely PD\_U and PD\_D. If the divided VCO leads the divided reference in phase or frequency ( $f_p$  leads  $f_c$ ), PD\_D pulses "low". If the divided reference leads the divided VCO in phase or frequency ( $f_c$  leads  $f_p$ ), PD\_U pulses "low". The width of either pulse is directly proportional to phase offset between the two input signals,  $f_p$  and  $f_c$ .

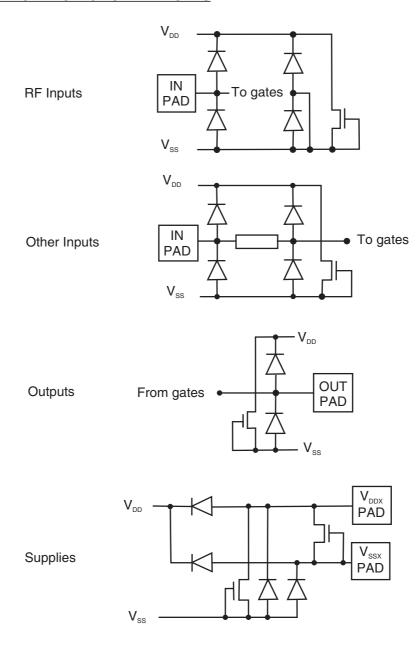

For the UP and DOWN mode, PD\_U and PD\_D drive an active loop filter which controls the VCO tune voltage. The phase detector gain is equal to  $V_{DD}/2\pi$ .

PD\_U pulses cause an increase in VCO frequency and PD\_D pulses cause a decrease in VCO frequency, for a positive Kv VCO.

A "lock detect" output, LD, is also provided via the pin Cext. Cext is the logical "NAND" of PD\_U and PD\_D waveforms, which is driven through a serial  $2k\Omega$  resistor. Connecting Cext to an external shunt capacitor provides low pass filtering of this signal. Cext also drives the input of an internal inverting comparator with an open drain output. Thus LD is an "AND" function of PD\_U and PD\_D.

## 1.11 <u>INPUT AND OUTPUT PROTECTION NETWORKS</u>

## 2. REQUIREMENTS

## 2.1 GENERAL

The complete requirements for procurement of the components specified herein are as stated in this specification and the ESCC Generic Specification. Permitted deviations from the Generic Specification, applicable to this specification only, are listed below.

Permitted deviations from the Generic Specification and this Detail Specification, formally agreed with specific Manufacturers on the basis that the alternative requirements are equivalent to the ESCC requirement and do not affect the component's reliability, are listed in the appendices attached to this specification.

## 2.1.1 <u>Deviations from the Generic Specification</u>

## 2.1.1.1 Deviations from Screening Tests - Chart F3

High Temperature Reverse Bias Burn-in and the subsequent Final Measurements for HTRB Burn-in shall be omitted.

#### 2.2 MARKING

The marking shall be in accordance with the requirements of ESCC Basic Specification No. 21700 and as follows.

The information to be marked on the component shall be:

- (a) Terminal identification.
- (b) The ESCC qualified components symbol (for ESCC qualified components only).
- (c) The ESCC Component Number.
- (d) Traceability information.

#### 2.3 <u>ELECTRICAL MEASUREMENTS AT ROOM, HIGH AND LOW TEMPERATURES</u>

Electrical measurements shall be performed at room, high and low temperatures.

## 2.3.1 Room Temperature Electrical Measurements

The measurements shall be performed at  $T_{amb}$ =+22 ±3°C.

| Characteristics                             | Symbols           | MIL-STD-883 | Test Conditions  | Lin  | nits | Units |

#### **NOTES:**

#### Continuity test

Comparison limit value, no measurement value recorded.

#### 2. Dynamic current

For measurement of the dynamic current, the pattern  $main\_pattern$  is used and loops from first to last vector. Instantaneous current is measured and recorded (without any link to a specific vector number). total combined current for all  $V_{DD}$  pins. During the test, outputs are loaded with a capacitive load < 62 pF (tester load) but without active load. Comparators are disabled during this test.

#### 3. Quiescent current

During quiescent current test, outputs are loaded without active current load but with a capacitive load < 62 pF (tester load).

The measurement is performed with the device having been initialised using pattern *mode*, stopped at end of vector labelled *pdwn\_sp*. Total combined current of all V<sub>DD</sub> pins.

The measurement accuracy is better than  $1\mu A$ .

#### Functional test

During functional test, outputs are loaded with an active current load (when specified) and a capacitive load < 62 pF (tester load). For the active current load, the threshold load switching is set to  $V_{DD}/2$ .

Output comparison is performed as "strobe comparison". Strobe is placed 5% before the end of the period. For the open-drain output (i.e. pin 51, LD), comparison to the "High-Impedance" state may be masked for some vectors.

## 5. Input voltages

During input voltage test, outputs are loaded with an active current load (when specified) and a capacitive load < 62 pF (tester load). For the active current load, the threshold load switching is set to  $V_{DD}/2$ .

Measurements are performed using the test pattern *main\_pattern* (between the labels "main\_st" and "end\_u\_d"). The pattern is run with increasing or decreasing input voltage value of the pin under test until the first output fails. Remaining pins toggle with nominal input voltages.

All the values are tested and recorded for each input.

The measurement accuracy is better than 100mV.

#### 6. Output voltages

Measurements are performed using the test pattern *main\_pattern*.

The device is configured into correct state so that outputs are placed in high or low voltages. Output current is sourced/sinked and the resulting voltage is measured.

All the values are tested and recorded for each output.

#### 7. High impedance leakage current

The device is configured into the correct state using the pattern main\_pattern so that the pin under

PAGE 27

**ISSUE 1** 

test is in high impedance conditions (i.e. stop at label "llzhh"). All the values are tested and recorded for each output.

#### 8. Test patterns

Number of vectors (clock periods) for patterns used during test are:

- main\_pattern 117065 vectors @ 1MHz (period = 1000ns) and 10MHz (period = 100ns)

- dsm\_p1 1806 vectors @ 1MHz (period = 1000ns)
 - mode 238 vectors @ 1 MHz (period = 1000ns)

## 9. <u>Timing generators</u>

All inputs use DATA mode timing generators (i.e. NRZ mode with zero delay) unless otherwise specified. The table below describes the timing generators. All patterns use the same set of timing

## generators:

| Timing<br>Generator<br>Number | Period<br>(ns) | Pin Group                                   | Delay<br>(ns) | Width<br>(ns) | Comp.<br>Start<br>(ns) | Comp.<br>Stop<br>(ns) | Format |

|                               |                | SDATA pin                                   | 10            | -             | -                      | -                     | NRZ    |
|                               |                | 2 and 4                                     | 100           | -             | -                      | -                     | NRZ    |
|                               |                | 4 to 7                                      | -             | -             | -                      | 950                   | EDGE   |

## 10. <u>Dynamic measurements</u>

Parameters shall be measured and recorded for each dynamic parameter to be tested. The measurement accuracy is better than 0.5ns.

#### 11. RF measurements

The frequency is set to the target frequency and output level at the FIN pin. The resulting output power is measured on DOUT.

The measurement accuracy is better than 0.1dB.

#### 12. Phase Noise measurements

The Phase Noise measurements use a "Stack-and-Rack" solution. The parametric test settings are described hereafter:

- f<sub>IN</sub> =1920.4MHz
- $f_r = 100 \text{ MHz (0dBm)}$
- $f_c = 20MHz$
- Loop Bandwidth = 50kHz
- Register M = 8
- Register R = 4
- Register A = 6
- Register K = 5243
- Modulus = 10

## 13. Operating current during Phase Noise measurement

The parametric test settings are described in Note 12 above.

## 2.3.2 <u>High and Low Temperatures Electrical Measurements</u>

The measurements shall be performed at  $T_{amb}$ =+85 (+0 -5)°C and  $T_{amb}$ =- 40(+5-0)°C.

The characteristics, test methods, conditions and limits shall be the same as specified for Room Temperature Electrical Measurements, except as follows:

| Characteristics                             | Symbols           | MIL-STD-883 | Test Conditions  | Limits |      | Units |
|---|-------------------|-------------|--|--------|------|-------|
|   |                   | Test Method |  | Min    | Max  |       |
| Standby Supply<br>Current with<br>Prescaler | I <sub>DDQ1</sub> | 3005        | V <sub>DD</sub> =3.45V, V <sub>SS</sub> =0V<br>Use pattern <i>mode</i> ,<br>stop at label <i>pdwn_sp</i> | -      | 1000 | μА    |

#### 2.4 PARAMETER DRIFT VALUES

Unless otherwise specified, the measurements shall be performed at  $T_{amb}$ =+22  $\pm$  3°C.

The test methods and test conditions shall be as per the corresponding test defined in Room Temperature Electrical Measurements.

The drift values ( $\Delta$ ) shall not be exceeded for each characteristic specified. The corresponding absolute limit values for each characteristic shall not be exceeded.

| Characteristics  | Symbols              |            | Limits |       | Units |  |
|--|----------------------|------------|--------|-------|-------|--|
|  |                      | Drift      | Abso   | olute |       |  |
|  |                      | Value<br>Δ | Min    | Max   |       |  |
| Supply Current during Phase Noise Measurements, Typical High V <sub>DD</sub>           | I <sub>DDOPPN2</sub> | ±10%       | 5      | 80    | mA    |  |
| CMOS Output Voltage, Low Level<br>(High Current Buffer at Minimum<br>V <sub>DD</sub> ) | V <sub>OL1_H</sub>   | ±50        | -      | 400   | mV    |  |
| CMOS Output Voltage, High Level (High Current Buffer at Minimum V <sub>DD</sub> )      | V <sub>OH1_H</sub>   | ±0.1       | 2.25   | -     | V     |  |
| Prescaler Input Sensitivity (Medium 1 f <sub>IN</sub> )                                | S <sub>FIN300</sub>  | ±2         | -      | -5    | dBm   |  |

## 2.5 <u>INTERMEDIATE AND END-POINT ELECTRICAL MEASUREMENTS</u>

Unless otherwise specified, the measurements shall be performed at  $T_{amb}$ =+22 ±3°C.

The characteristics, test methods, conditions and limits shall be as specified for Room Temperature Electrical Measurements.

#### 2.6 POWER BURN-IN CONDITIONS

## 2.6.1 <u>Electrical Test Conditions</u>

Electrical test conditions shall be in accordance with the table below:

| Characteristics                | Symbols         | Test Conditions | Units |
|--------------------------------|-----------------|-----------------|-------|
| Core Supply Voltage            | V1              | 3.45 (+0 -5%)   | V     |
| Output Bias Voltage            | V2              | 1.725 (±5%)     | V     |
| Input Voltage (Digital Inputs) | V <sub>IN</sub> | 0 to V1         | V     |
| Vector Length                  | t <sub>O</sub>  | 1               | μs    |

#### 2.6.2 Environmental Test Conditions

Environmental test conditions shall be in accordance with the table below:

| Characteristics     | Symbols          | Test Conditions | Units |
|---------------------|------------------|-----------------|-------|
| Ambient Temperature | T <sub>amb</sub> | +125 (+0 -5)    | °C    |

#### 2.6.3 Burn-in Stimulus

The device shall be burned-in using "functional" vectors.

The Burn-in stimulus shall be made with vectors looping indefinitely. Each vector shall be made with thirteen (13) drivers. Each driver uses DATA mode, i.e. Non Return to Zero (NRZ) mode with toggling at the beginning of the vector. Looping this burn-in pattern exercises the PLL and PD\_U/PD\_D outputs toggle.

The device shall be set up in direct mode and counters loaded with checkerboard values in such a way that the PD\_U and PD\_D pins toggle alternately. The device shall go sequentially through seven (7) bypass modes and sixteen (16) normal modes. Each mode includes eighty-six (86) vectors or forty-three (43) FIN clock cycles. FR (resp. MS2\_SEL and RND\_SEL) toggles every 11 (resp. 19 and 13) periods of FIN. There shall be 1978 vectors.

| PRE_EN       | A (hex) | K (hex) | M (hex) | R (hex) | FIN/FR ratio |
|--------------|---------|---------|---------|---------|--------------|
| By-pass mode |         |         |         |         |              |
| 1            | -       | -       | 155     | 2A      | 7.95         |
| 1            | -       | -       | 155     | 15      | 15.55        |
| 1            | -       | -       | AA      | 2A      | 3.98         |
| 1            | -       | -       | AA      | 15      | 7.77         |
| 1            | -       | -       | 1FF     | 15      | 23.27        |
| 1            | -       | -       | 1FF     | 3F      | 8            |

#### 2.6.4 Burn-in Schematic

The following schematic shows a suitable burn-in configuration for a single socket.

#### **NOTES:**

- 1. V1 is connected via a 500mA fuse.
- 2. V2 is connected via a 100mA fuse.
- 3. All resistors have a tolerance of  $\pm 1\%$ . All capacitors have a tolerance of  $\pm 10\%$ .
- 4. D1, D2, D3 etc. are Driver Numbers.
- 5. TP1 and TP2 are the Test Probes.

## 2.7 OPERATING LIFE CONDITIONS

The conditions shall be as specified for Power Burn-in.

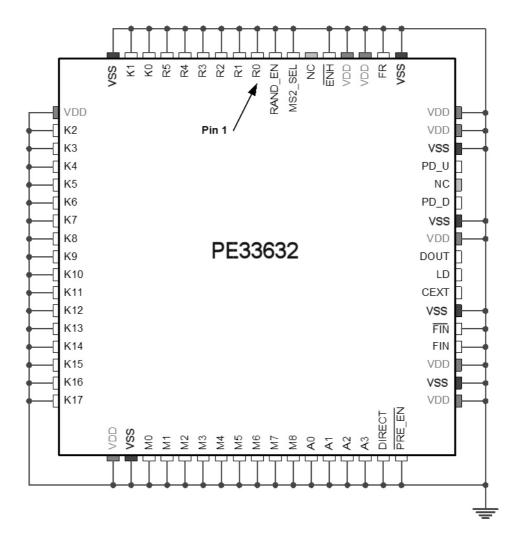

## 2.8 <u>TOTAL DOSE RADIATION TESTING</u>

# 2.8.1 <u>Bias Conditions and Total Dose Level for Total Dose Radiation Testing</u>

Bias shall be applied during irradiation testing as specified below.

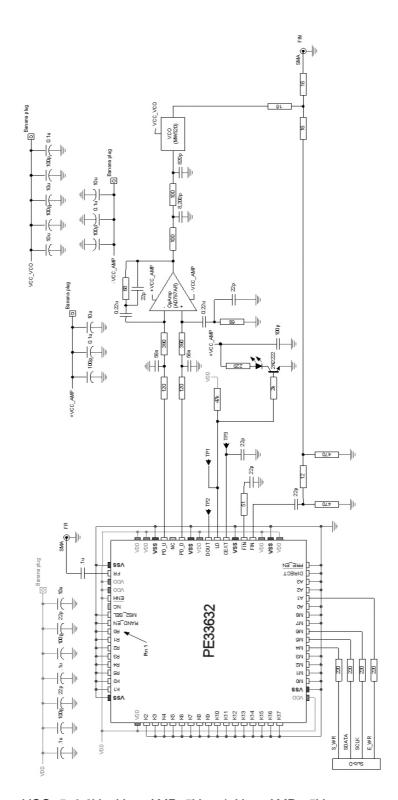

The total dose level applied shall be as specified in the component type variant information herein or in the Purchase Order.

The following schematic shows a suitable test configuration for a single socket in unbiased condition (OFF).

The following schematic shows a suitable test configuration for a single socket in biased condition (ON).

## **NOTES:**

- $\rm V_{DD}$  =3.3V,  $\rm V_{CC}$  VCO=5±0.2V, +V\_{CC} AMP=5V and -V\_{CC}+AMP=-5V.  $\rm f_r$  =40MHz,  $\rm V_P$  =V  $_{SS}$  to  $\rm V_{DD}$  .
- 2.
- $f_{IN}$ =1920.4 MHz,  $V_P$ = $V_{SS}$  to  $V_{DD}$ . 3.
- 4. All resistors have a tolerance of  $\pm 1\%$ . All capacitors have a tolerance of  $\pm 10\%$ .
- 5. TP1, TP2 and TP3 are the Test Probes.
- 6. The table below shows how the device shall be serially programmed during Total Dose Radiation

Testing so the  $f_{\mbox{\scriptsize IN}}$  frequency is 1920.4 MHz.

| Description         | Value  |
|---------------------|--------|
| R Counter           | 1      |
| K Counter           | 5243   |
| M Counter           | 8      |
| A Counter           | 6      |
| Reference Frequency | 40 MHz |

## 2.8.2 <u>Electrical Measurements for Total Dose Radiation Testing</u>

Unless otherwise specified the measurements shall be performed at  $T_{amb}$ =22 $\pm$ 3 $^{o}$ C.

The characteristics, test methods, conditions and limits shall be as specified for Room Temperature Electrical Measurements.

# **APPENDIX 'A'**

## AGREED DEVIATIONS FOR PEREGRINE SEMICONDUCTOR EUROPE

| ITEMS AFFECTED   | DESCRIPTION OF DEVIATIONS   |
|--|---|
| Deviations from Wafer<br>Lot Acceptance - Chart<br>F2                | The SEM inspection may be performed using the specified ESCC Method or, alternatively, may be carried out in accordance with the requirements of MIL-STD-883 Test Method 2018.  |
| Deviations from<br>Screening Tests - Chart<br>F3                     | Following the PIND test, a Seal Test (Fine and Gross Leak) shall be performed in accordance with MIL-STD-883 Test Method 1014. An External Visual Inspection shall then be performed in accordance with ESCC Basic Specification No. 20500. |
|  | Initial High and Low Temperatures Electrical Measurements may be performed prior to Burn-in at the option of the Manufacturer.  |
|  | The Check for Lot Failure shall only take into account any failures during Room Temperature Electrical Measurements. The number of failed components shall not exceed 5% of the components submitted to Burn-in.                            |
|  | Room Temperature Electrical Measurements may be performed after Seal Test (Fine and Gross Leak).  |
| Deviations from<br>Qualification and<br>Periodic Tests - Chart<br>F4 | Permanence of Marking shall not be performed on devices which have been laser marked.   |
