**NOTES**

- GO-NO-GO Test, each pattern of Test Table 4(a).  
 $V_{OH} \geq V_{DD} - 0.5Vdc$        $V_{OL} \leq 0.5Vdc$
- Maximum time to output comparator strobe 300µsec.
- Test each pattern of Test Table 4(b).
- Interchange of forcing and measuring function is permitted.
- This is performed as a Functional Test in which extreme  $V_{IN}$  conditions are applied and output voltage is measured.
- Measurement performed on a sample basis, LTPD7 or less, with a Capacitance Bridge connected between each input under test and  $V_{SS}$ , only for Lots where LAT Level 2 is to be performed. (For LTPD sampling plan, see Annexe I of ESA/SCC 9000).
- Measurement performed on a sample basis, LTPD7 or less, (see Annexe I of ESA/SCC 9000).
- Before commencement of test, load all stages with low or high in accordance with Test Table 4(a) and measure propagation delay time at change.
- A pulse, having the following conditions, shall be applied to the clock input:  $V_p = 0Vdc$  to  $V_{DD}$  Vdc. Maximum clock frequency  $f_{(CL)}$  requirement is considered met if proper output state changes occur with the pulse repetition rate set to that given in the "Limits" column.
