1.3 MAXIMUM RATINGS

The maximum ratings, applicable to the finished wires and cables specified herein, which shall not be exceeded at any time during use or storage in controlled space environment, are scheduled in Table 1(b).

1.4 PARAMETER DERATING INFORMATION

The derating information applicable to the finished wires and cables specified herein is as follows:

- The maximum current for each wire used in a bundle shall be:-

$$I_{Bmax} = I_{max} \times \frac{29 - n}{28} \quad (\text{for } 1 \leq n \leq 15)$$

$$I_{Bmax} = \frac{I_{max}}{2} \quad (\text{for } n > 15)$$

where n = number of wires in the bundle.

- The temperature derating information is shown in Figure 1 with maximum current I_{max} for a single wire.
- The derating factors contained herein indicate maximum stress values and do not preclude further derating.

1.5 PHYSICAL CHARACTERISTICS

The physical characteristics of the wires and cables specified herein are shown in Figure 2 and Table 1(a).

1.6 FUNCTIONAL DIAGRAM

The materials and finishes shall be as specified herein. Where a definite material is not specified, a material which will enable the wires and cables specified herein to meet the performance requirements of this specification shall be used. Acceptance or approval of any constituent material does not guarantee acceptance of the finished product.

4.4.1 Conductor

4.4.1.1 Material Characteristics

All strands used in the manufacture of the conductors shall be silver-coated, soft or annealed, oxygen-free high conductivity copper for ISO 004, 006, 012 and 030 and silver – coated high strength copper alloy for ISO 001, 002 and AWG 28 and 30.

The silver thickness shall be 2.0 microns minimum.

For all copper conductors, any strand shall show a 10% minimum elongation.

For high-strength copper alloy conductors, the tensile characteristics shall be not less than 6% in elongation and 35kg per square mm in tensile strength.

For determination of the conductor resistance at +20°C, as mentioned in Para 9.5 of ESA/SCC Generic Specification No. 3901, the α coefficient for copper alloy is 0.0035.

4.4.1.2 Stranding

The conductors shall be constructed of concentrically laid strands to produce a smooth and uniform conductor of circular cross-section and free from any high strands or other surface irregularities.

The length of lay of the external layer shall not be less than 8, nor more than 16, times the maximum conductor diameter specified in Table 1(a).

4.4.2 Insulation

4.4.2.1 Material

Any insulating material shall be virgin high strength toughened fluoropolymer and PTFE with only those additives that are necessary for processing and pigmentation.

4.4.2.2 Construction

The insulation shall have a uniform cross-section throughout the length of the wire and the conductor shall be evenly centred in the insulation.

The insulation shall consist of one wrapped lay of HST-F tapes (min. 76% overlap, wall thickness 0.1 mm nom.) and one lay of PTFE tapes (min. 51% overlap, wall thickness 0.05 mm nom.) as specified in Figure 2(a).

4.4.3 Shield

4.4.3.1 Material Characteristics

Shield strands shall meet the requirements for silver-coated annealed copper outlined in Para. 4.4.1.1 of this specification.

4.4.3.2 Construction

The shield shall be closely and helically wound around the single insulated wire or twisted bundle of insulated wires (core) and provide not less than 90% coverage as calculated by the following formula:

$$K = \frac{n \times d_w - \sqrt{(\pi D)^2 + P^2}}{P\ \pi D} \times 100(\%)$$

K = Coverage (%).
n = Number of serving wires.
d_w = Shield strand diameter (mm).
D = Diameter of core (mm).
P = Serving Pitch (mm).
