1. V_H shall be derived as follows:-

- (i) Slowly increase input voltage (V_{IN}) from 0V until the output condition (V_{OUT}) changes. Record the value of V_{IN} at which the change occurs and call it V_{TP} .
- (ii) Slowly decrease input voltage (V_{IN}) from 5V until the output condition changes. Record the value of V_{IN} at which the change occurs and call it V_{TN} .
- (iii) $V_H = V_{TP} - V_{TN}$.

2. Measurement of 'A' inputs shall be performed with $1\bar{G} = 0.7V$ and $2\bar{G} = 2.0V$. Inputs not under test shall be open.

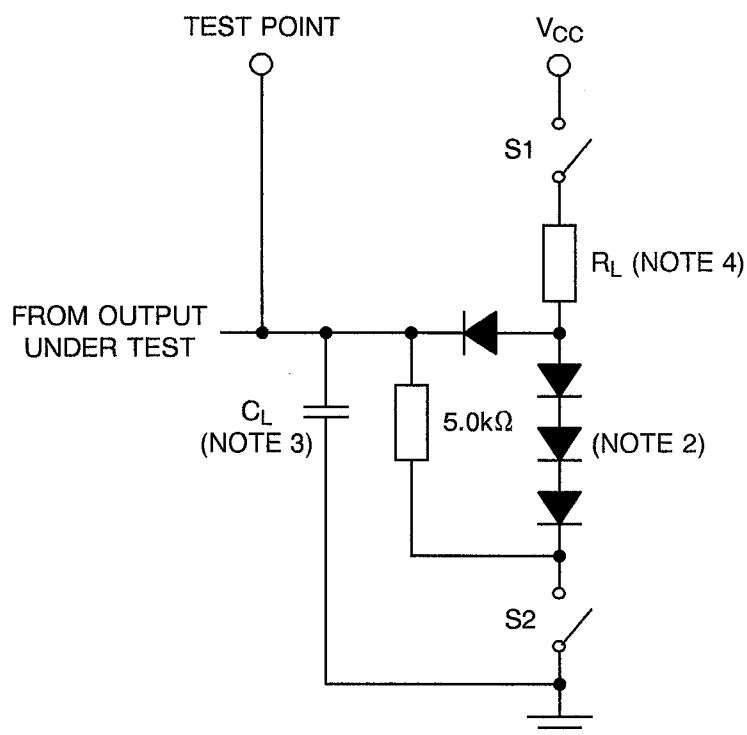

3. For measurement of G and \bar{G} inputs, an appropriate output shall be monitored and the input condition for that output shall be such that the output is high when enabled.

All inputs not under test shall be open.

3. $C_L = 45\text{pF}$ or $5.0\text{pF} \pm 5\%$ (see Table 2) including scope, wiring and stray capacitance without package in test fixture.
4. $R_L = 667\Omega \pm 5\%$.
5. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control.
Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
6. When measuring propagation delay time of 3-State Outputs, S1 and S2 are closed.
