The materials and finishes shall be as specified herein. Where a definite material is not specified, a material which will enable the wires and cables specified herein to meet the performance requirements of this specification shall be used. Acceptance or approval of any constituent material does not guarantee acceptance of the finished product.

##### 4.4.1 Conductor

###### 4.4.1.1 Material Characteristics

All strands used in the manufacture of the conductors shall be silver-coated, soft or annealed, oxygen-free high conductivity copper from AWG 12 to 22 inclusive and silver-coated, high strength copper alloy from AWG 24 to 28. On silver-coated strands, the thickness of the silver shall be 2 microns minimum.

On all copper conductors, any strand shall show a 10% minimum elongation. On all high-strength copper alloy conductors, any strand shall show a 6% minimum elongation at break and a 350N/mm<sup>2</sup> minimum tensile strength.

The resistance of the conductors shall be determined at +20°C in accordance with Para. 9.5 of ESA/SCC Generic Specification No. 3901, where the 'α' coefficient for copper alloy is 0.0035.

###### 4.4.1.2 Stranding

The conductors shall be constructed of concentrically laid strands to produce a smooth and uniform conductor of circular cross-section and free from any high strands or other surface irregularities.

The length of the left-hand lay of the external layer shall not be less than 8, nor more than 16, times the maximum conductor diameter specified in Table 1(a).

##### 4.4.2 Insulation

###### 4.4.2.1 Material

Any insulating material shall be virgin polyimide with only those additives that are necessary for processing and pigmentation.

###### 4.4.2.2 Construction

Each ribbon (30µm of thickness) shall conform to 0.1/1.0/0.1 type according to MIL-W-81381. The insulation shall have a uniform cross-section throughout the length of the cable and the conductor shall be evenly centred in the insulation. The nominal wall thickness, including the polyimide protective coating, shall be 0.14mm.

###### 4.4.2.3 Insulation Colour

The insulation colour is prescribed in relation to the wire size as shown in the table of Para. 4.4.7.

Shield strands shall meet the requirements for silver-coated annealed copper as outlined in Para. 4.4.1.1. of this specification.

##### 4.4.4.2 Construction

The shield shall be closely, helically wound round the strands and provide not less than 92% coverage, 'K' being calculated by the following formula:-

$$K = \frac{n.d \sqrt{(L^2 + P^2)}}{P.L}$$

where:-

- K = % coverage,
- n = total number of shield strands,
- d = mean shield strand diameter,
- L = apparent shielding lay,

- P =  $\pi(D + d)$  - for a single core cable,
- P =  $\pi(D + d) + xD$  - for a multicore cable.

where:-

- D = mean diameter of core insulation,
- x = number of cores.

#### N.B.

The shield may exhibit an occasional gap between strands provided that:
