3. Pulse width $\leq 3.0s$, Period $\leq 1.0ms$, Amplitude = +0V to -10V.

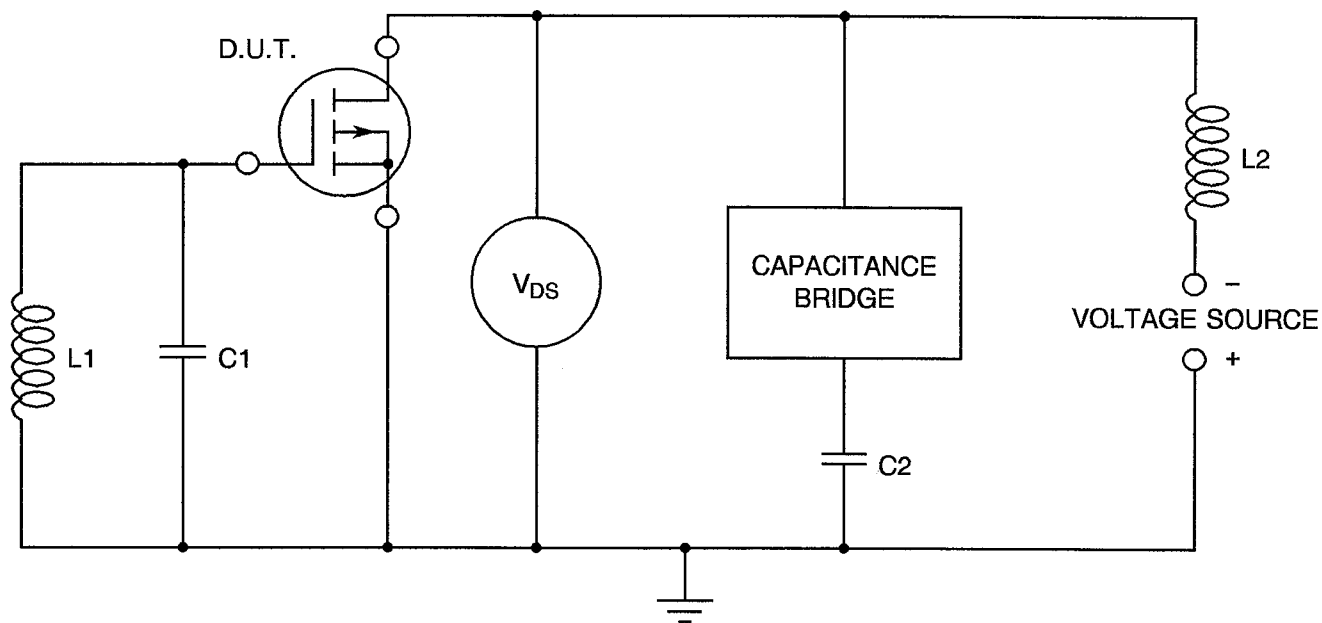

NOTES

1. When measuring rise time, $V_{GS(ON)}$ shall be as specified on the input waveform.
2. When measuring fall time, $V_{GS(OFF)}$ shall be as specified on the input waveform.
3. The input transition and drain voltage response detector shall have rise and fall response times such that doubling these responses will not affect the results greater than the precision of measurement.
4. The current shall be sufficiently small so that doubling it does not affect test results greater than the precision of measurement.

FIGURE 4 - CIRCUITS FOR ELECTRICAL MEASUREMENTS (CONTINUED)

FIGURE 4(c) - COMMON SOURCE OUTPUT CAPACITANCE

PROCEDURE

The capacitors C1 and C2 shall present apparent short circuits at the test frequency. L1 and L2 shall present a high a.c. impedance at the test frequency for isolation. The bridge shall have low d.c. resistance between its output terminals and should be capable of carrying the test current without affecting the desired accuracy of measurement.

NOTES

- Using the circuit shown in Figure 5(b), power shall be applied to the device to achieve the specified junction temperature. The junction temperature (T_J) should be determined as follows:-

$$T_J = (P_T) \times (R_{TH(J-C)}) + T_{case}$$

$$P_T = (V_{DS}) \times (I_D)$$

$$R_{TH(J-C)} = 5.0^\circ\text{C/W}$$

$$T_{case} = \text{Measured value at the hottest point on the case.}$$
