NOTES

- GO-NO-GO Test, each pattern of Test Table 4(a).
 $V_{OH} \geq V_{DD} - 0.5V_{dc}$ $V_{OL} \leq 0.5V_{dc}$
- Maximum time to output comparator strobe 300 μ sec.
- Measure each value of I_{DD} for the input conditions given in Table 4(b).
- For characterisation during qualification, the incremental method or the method shown in Figure 4(g) (ii), which incorporates a plotter, shall apply. For procurement, the Orderer may accept that the devices are tested go-no-go to the maximum limits of Table 2. In the case that go-no-go testing is performed, it is necessary that at least one discrete value shall be measured and recorded in order that drift values may be applied. Figure 4(g) (iii) shall be used for the discrete value measurement.
- This is performed as a Functional Test in which extreme V_{IN} conditions are applied and channel selection is monitored.
- Measurement performed on a sample basis, LTPD 7 or less, with a Capacitance Bridge connected between each input under test and V_{SS} , only for Lots where LAT Level 2 is to be performed. (For LTPD sampling plan, see Annexe I of ESA/SCC 9000).
- Measurement performed on a sample basis LTPD 7, or less (see Annexe I of ESA/SCC 9000).
