- 8 Comparison between proton and neutron + dose
- 9 Conclusion

Study objectives

- 1 Establish an industrial methodology for optocoupler radiation testing
 - 4 validate the calculation of equivalent monoenergetic proton fluence with help of NIEL, whatever proton energy is concerned
 - 4 quantify the additional degradation due to ionizing dose when proton testing does not allow to reach expected in flight dose level (electron rich orbits)
 - 4 validate the possibility to perform a combination of [neutron + ionizing dose] testing instead of proton testing

Test Plan 1/					
Devices tested					
Device type	Manuf.	Version	Proton sample size	Neutron/TID sample size	TID sample size
4N49	Optek	Standard	15 x 3 Ep	18	18(HDR)+18(LDR)
4N49	Isolink	standard	15 x 3 Ep	18	18(HDR)+18(LDR)
4N49	Micropac	standard	15 x 3 Ep	18	18(HDR)+18(LDR)
66099	Micropac	Hardened to displac ^t damage and TID	12 x 3 Ep	12	9(HDR)+9(LDR)
66168	Micropac	Hardened to displac ^t damage	15 x 3 Ep	18	18(HDR)+18(LDR)
66163	Micropac	standard	15 x 3 Ep	18	18(HDR)+18(LDR)
OLH249	Isolink	Hardened to displac ^t damage	12@Ep=60 MeV 9@Ep=200 MeV	9	9(HDR)+9(LDR)

Test Plan 4/

Proton irradiation : at PSI, Villingen

4 3 proton energies : 15, 60 and 200 MeV

	STEP0	STEP1	STEP2	STEP3	STEP4	STEP5	STEP6	STEP7
15 MeV	0 (0k)	(1k)	1.24e+10	2.48e+10	4.9e+10	1.2e+11	1.8e+11	2.42e+11
		(5k)	(10k)	(20k)	(50k)	(75k)	(100k)	
60 MeV	0	7.26e+9	3.63e+10	7.26e+10	1.5e+11	3.63e+11	5.45e+11	7.27e+10
200 MeV	0	1.74e+10	8.59e+10	1.72e+11	3.44e+11	8.6e+11	1.27e+12	1.72e+12

4 OPTIS line for 15 and 60 MeV protons, PIF line for 200 MeV

Test Plan 5/

Neutron irradiation : Prospero neutron accelerator from CEA Valduc

Prot. Eq. Dose (krad)	0	10 kRad	20 kRad	50 kRad	75 kRad	100 kRad
Prot. 15 MeV (p/cm²)	0	2.4e+10	4.8e+10	1.2e+11	1.8e+11	2.4e+11
Neut. 1 MeV(n/cm²)	0	1.84e+11	3.7e+11	9.24e+11	1.38e+12	1.84e+12

4 flux from 2.05 to 6.2 10E8 n/cm²/s

4 neutron energies from 100 keV to 6 MeV spectrum, assimilated to 1 MeV neutron based on displacement damage in Silicon

Test Plan 6/

I Cobalt 60 irradiation

4 low dose rate (<140 rad/h) : Shepherd 484, ASTRIUM, Velizy

0 kRad	10 kRad	22 kRad	39 kRad	56 kRad	66 kRad	75 kRad	102 kRad
--------	---------	---------	---------	---------	---------	---------	----------

steps for low dose rate experiment

4 high dose rate (50 krad/h) : PAGURE line, CISbio Int., Saclay

0 kRad	20 kRad	50 kRad	100 kRad
--------	---------	---------	----------

steps for high dose rate experiment

Conclusion

9

36

Novembre 2000

© Astrium

Conclusion 1/2

- | A lot a data to analyse!
- | Displacement damage is the main degradation mechanism
- | biasing conditions during irradiation have an impact only for standard devices, for CTR values measured at low I_f
- | NIEL concept works well, when using Barry 's table
- | protons and neutrons results very well correlated for hardened devices, slight differences for unhardened devices
- | Test methodology applicable for all optocoupler types

37

Novembre 2000

© Astrium

Conclusion 2/2

- | Still to perform
 - 4 analysis of dose rate influence for Cobalt 60 results
 - 4 complete tables for 3 remaining types
 - 4 analysis of neutron spectrum in GaAs
